

## - english informations -

Due to decades of experience in birdkeeping I developed an aviary system which can be extended size-wise as well as according to technology and equipment. The system is maintenance-free due to our eloxed aluminium frame parts and hot dipped tellises with different mesh apertures Installation and extension of the system is easy due to a rotating sliding mortise system which is suitable for all fittings and accessoires (e.g. supporters for sitting bars and nesting boxes). Enclosed mounting instructions for the installation of all premanufactured connections shows the simplicity of this system.

In our catalogue you will see outdoor aviaries ranging from the "Brasilien" type up to the "Guyana" type which can be supplied with different mesh apertures. Optional, light cuplolas, glass fiber plastics or double-webbed plates in the standard widths can be used for protection against weather. The indoor aviaries called "Kamerun", "Kongo" and "Mexico" can be extended in length and width shown in the center of the catalog.

All indoor aviaries are equipped with a chest of excrement which can be pulled out of both sides. Due to its standard width of approx. 70 cm the "Mexico" type aviary fits through every terrace door and can be extended like an outdoor aviary in the grid of 342-690 and 1,032 mm.

The equipment for food can be supplied in two variations: As a turning ring for two bowls or food flap for three bowls both can be supplied in aluminum or high-grade steel. All doors of the outdoor aviaries open inwards and outwards as well as to the right or left side.

Our aviaries can be supplied in the standard heights of 1,700 mm, 2,064 mm and 3,096 mm using a special construction. It is possible to achieve a height of 4,128 mm with trellises of 25 x 2 mm. Beginning with „Bau- und Erweiterungsrahmen“ you will find equipment and spare parts for aviaries.
